

Blocking Threats at the Door

Detect and stop malicious software before it reaches your network

Detect and Stop Threats

The most efficient place to stop viruses and other malicious software is before they reach your desktop and notebook computers. In most cases, this means checking them at your email server. Even better is refusing them any access to your server.

Because of its built-in openness, email is the primary method for spreading viruses, Trojans, worms and their companions.

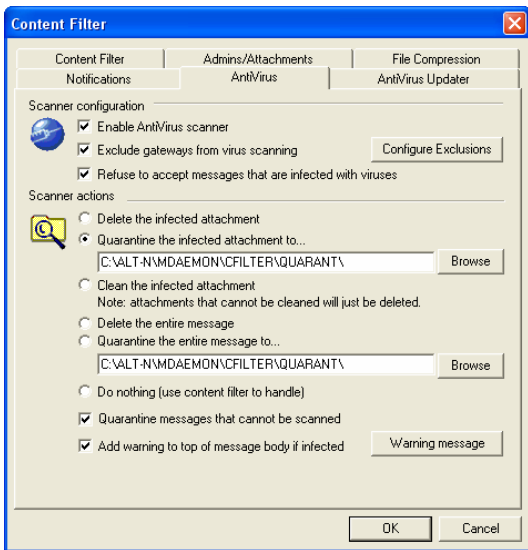

- Inline Scanning:** When an organization permits infected emails to enter their network, they assume responsibility for neutralizing any security threat and the notifying concerned parties. With inline scanning, infected messages are caught at the door and never allowed to enter. This saves time, processing power and bandwidth, all of which are better spent on other tasks.

What You Get

- Scanning for local domains
- Scanning for gateways
- Inline scanning for most messages
- Offline scanning option
- Inbound and outbound exclusions
- Options to delete, clean, quarantine or pass messages to content filtering
- Automatic signature file updates on user-defined schedule
- Free emergency update notifications for registered users

Requirements

- AntiVirus for MDAEMON has minimal hardware and software requirements.
- Software:* Windows 2000 and later, including XP and the latest servers
- CPU:* Pentium II 450 MHz
- Memory:* 256 MB RAM
- Disk Space:* 30 MB, plus more for mail storage
- Email Server:* MDAEMON 6 or later, MDAEMON 8 or later for inline scanning
- Network:* TCP/IP with connection to Internet, Intranet or LAN

Alt-N has enabled the inline option as the default AntiVirus scanning method for MDAEMON.

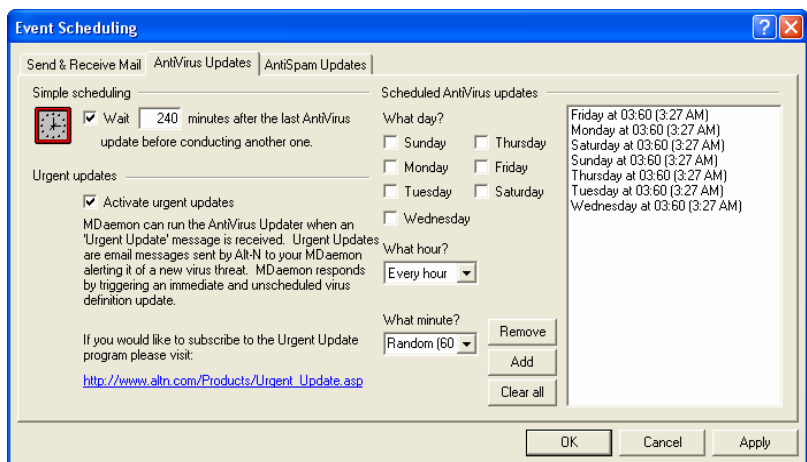

- Offline Scanning:** After messages are received, they are scanned by AntiVirus. Infected messages are cleaned, quarantined, deleted or delivered.
- Signature Files:** Scanning recognizes would-be invaders by looking for the digital signatures of known threats.
- Heuristic Detection:** To stop new threats, AntiVirus checks messages and attachments for threat-like content.
- Updated Signatures:** By default, AntiVirus checks daily for signature file updates. You can schedule this..

AntiVirus for MDAEMON is a virus scanner designed to detect malicious content embedded or attached to email messages. MDAEMON uses AntiVirus for inline scanning during the SMTP session, immediately refusing any infected messages before they can reach your users. Doing this stops any trouble before it starts.

- Urgent Updates:** You can sign up for free urgent update notifications which proactively protect you from new threat outbreaks.

Why Use AntiVirus

- High Performance:** AntiVirus for MDAEMON is designed to handle the high-traffic volume of an email server. When coupled with other MDAEMON security measures, AntiVirus for MDAEMON can largely eliminate email-borne threats aimed at your computers and network.
- Low Maintenance:** AntiVirus for MDAEMON is easy to install, configure and maintain. Once you install and configure it, you can almost forget about it. Once configured, AntiVirus handles its signature file maintenance automatically.
